SR685A
Thinksystem SR680a/SR780a V3 System Board

Three systems may draw approximately 27-36kw under typical load and up to 45-60kw under peak gpu utilization.

Base on estimated peak draw vs assumed drop capacity, the current 3 chassis, per rack configuration on the existing power infrastructure, any ‘best effort’ deployment in this environment appears significantly under-provisioned and carries the high risk of thermal shutdown, circuit failure, hardware damage, system instability.

In addition to the power infrastructure constraints, there’s also physical constraints. The physical rack depth appears insufficient with these 8U chassis, potentially impacting airflow and pdu placement.

Model: Thinkserver SR680/685/780 8U chassis

Minimum power config: 6 psu x 2600w ~15.6kw max psu capacity

Recommended power config: 8 psu x 2600w ~20.8kw max psu capacity
